

Project 1 : Divide & Conquer

Down below you'll see 2 different problems , in order to earn all the score of this project you are free to choose either one of these problems

- **Maximum subarray**

the **maximum sum subarray problem** is the task of finding a contiguous subarray with the largest sum of its elements

- You'll take one-dimensional array $A[1...n]$ integers
- The task is to find i, j that are indexes in the array such that the sum

$$\sum_{x=i}^j A[x] \text{ is as large as possible.}$$

- For example, for the array of values $[-2, 1, -3, 4, -1, 2, 1, -5, 4]$, the contiguous subarray with the largest sum is $[4, -1, 2, 1]$, with sum 6.

- **Strassen algorithm**

The **Strassen algorithm** is an algorithm for matrix multiplication. It is faster than the standard matrix multiplication algorithm and is useful in practice for large matrices. Research and study about this algorithm.

Attention!

1. All of the projects (no matter what you choose) will be tested for similarity by a coded script, So if we find an obvious similarity between 2 or more projects **all** of them will get **0** points
2. You are free to choose any programming language that you desire
3. You have to add a document file and **explain deeply** what you have done in your code and the algorithm you chose.

Extra points

If you want to get more score and a **opportunity** of something better , you have to do all these terms

- Code in **python**
- Write your document in **Jupyter** or [Colab](#)
- Write the document in **English**
